ARITHMETIC OPERATIONS USING RPC

AIM:

To Develop a simple calculator using XMLRPC

.

ALGORITHM:

Server.py

1. Import XMLRPCServer package
2. Define functions for addition, subtraction, multiplication, division and modulus
3. Initialize simple XMLRPCServer with IP address (or localhost) and port number
4. Register the functions add, sub, mul, div and mod with the server
5. Handle the request
6. Close the connection

Client.py

1. Import XMLRPC Client package
2. Define functions for addition, subtraction, multiplication, division and modulus
3. Initialize simple XMLRPC Client with Server IP address (or localhost) and port number
4. Get two numbers a and b for arithmetic operations
5. Call add() function and print the result
6. Call sub() function and print the result
7. Call mul() function and print the result
8. Call div() function and print the result
9. Call mod() function and print the result
10. Close the connection

CODE:

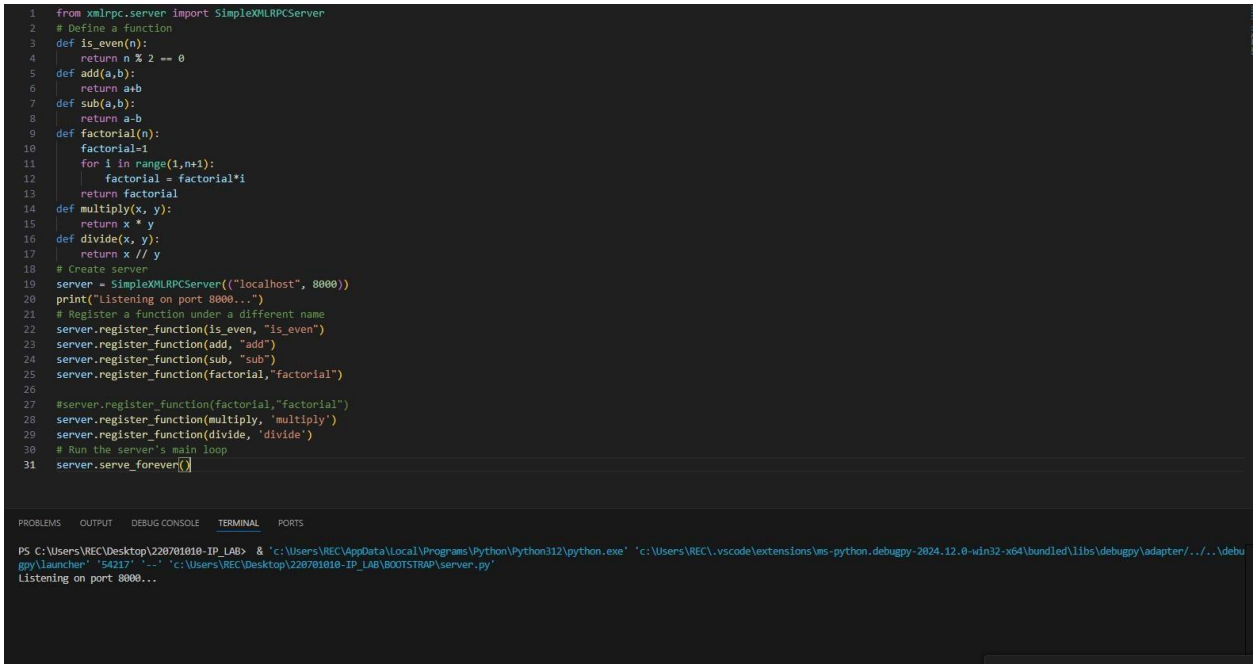
Server.py

```
XML RPC PROGRAM- SERVER SIDE:  from
xmlrpc.server import SimpleXMLRPCServer
# Define a function
def is_even(n):
return n % 2 == 0
```

```
def add(a,b): return
a+b def sub(a,b):
return ab def
factorial(n):
factorial=1  for i in
range(1,n+1):
factorial =
factorial*i return
factorial def
multiply(x, y):
return x * y def
divide(x,          y):
return x // y
# Create server
server = SimpleXMLRPCServer(("localhost", 8000))
print("Listening on port 8000...")
# Register a function under a different name
server.register_function(is_even, "is_even")
server.register_function(add, "add")
server.register_function(sub, "sub")
server.register_function(factorial,"factorial")

#server.register_function(factorial,"factorial")
server.register_function(multiply, 'multiply')
server.register_function(divide, 'divide')
# Run the server's main loop server.serve_forever()
```

Output:



```python
from xmlrpc.server import SimpleXMLRPCServer
# Define a function
def is_even(n):
    return n % 2 == 0
def add(a,b):
    return a+b
def sub(a,b):
    return a-b
def factorial(n):
    factorial=1
    for i in range(1,n+1):
        factorial = factorial*i
    return factorial
def multiply(x, y):
    return x * y
def divide(x, y):
    return x // y
# Create server
server = SimpleXMLRPCServer(("localhost", 8000))
print("Listening on port 8000...")
# Register a function under a different name
server.register_function(is_even, "is_even")
server.register_function(add, "add")
server.register_function(sub, "sub")
server.register_function(factorial,"factorial")

#server.register_function(factorial,"factorial")
server.register_function(multiply, 'multiply')
server.register_function(divide, 'divide')
# Run the server's main loop
server.serve_forever()
```

```
